### WHAT IS IT?

Used in Herbal Medicine to support the immune system.

### KEY INGREDIENTS

**Mycellium** – is the name of the early harvest or 'baby' Ganoderma lucidum. There are different components and benefits of the Ganoderma mushroom – the spores (seeds ready to pollinate), the Mycellium (early harvest, these threads have their own unique properties) and the lucidum (the mature plant). Mycellium threads are the root-like body that produces mushrooms, resembling a network or web of activity.

### DID YOU KNOW?

The mycelium is the most important and permanent part of a fungus. The part of the mushroom that we see is only the "fruit" of the organism. The living body of the fungus is a mycelium made out of a web of tiny filaments called hyphae. The mycelium is usually hidden in the soil, in wood, or another food source. The mycelia network that emanates from a fungal spore can extend over and into the soil in search of nutrients. A mycelium can be tiny, or cover large spaces of land in search of nutrients to feed the flowering of the mushroom.
